

# FOR YOUR AC DURING THE SUMMER MONTHS

## Be More Energy Efficient

Set your air conditioning to a comfortable, non-extreme temperature of about 74 degrees. This will keep your home at a pleasant temperature, and you won't end up with a large energy bill.

## Don't Leave You're A/C on The Coolest Setting

You don't want to have your A/C unit working overtime to cool down your home, or it will end up reducing your HVAC lifespan. Take into account the temperature before you turn on your A/C. Cooling your room down slightly is usually enough, don't have your system running at full power for hours.

## Keep All Windows And Doors Closed

On a nice day, it can be tempting to keep a window open or two, but this helps your home remain comfortably cool and doesn't overwork your system.

## Install a Programmable Thermostat

If you're out at work, set your air conditioning to come on 30 minutes before you come home.

## Find a Setting That Works

Find a comfortable setting and then leave the A/C alone for the summer. You don't need to keep adjusting it.
